Ivan Evdokimov, Ph.D.

Manchester, UK | ivevdm@gmail.com | 07586774312 | linkedin.com/in/ivan-evdokimov | github.com/ivan020

Professional Summary

Software Engineer with 8+ years of production experience building backend systems, cloud infrastructure, and ML pipelines. Delivers across the full stack — PostgreSQL-backed APIs, CI/CD automation, AWS-based MLOps — with 95%+ model accuracy on sensitive datasets.

Experience

Senior Researcher, University of Essex — Colchester, UK — Oct 2026 — present

- Lead and directly manage two research software developers, providing technical direction, overseeing delivery, and supporting professional development; mentor colleagues across the department.
- Advise PhD researchers in Computer Science and Computational Finance on research methodologies and technical implementation.
- Design and implement CI/CD pipelines, conduct code reviews of senior developers' contributions, and oversee production software delivery using Docker and APIs.
- Develop secure software for highly sensitive research data, incorporating confidentiality, access control, hashing, pseudonymisation, and privacy-preserving data linkage.
- Build LLM-based solutions to extract and generate meaningful analytical features from unstructured qualitative data, integrating language models into research data-processing pipelines.

Research Assistant, University of Essex — Colchester, UK — Nov 2025 — Aug 2026

- Built GitHub Actions/Vercel CI/CD pipelines with automated unit and integration testing and code review, supporting an AI-assisted development workflow and enabling weekly releases across a multi-team SaaS platform.
- Deployed Dockerised end-to-end MLOps pipeline for a SaaS platform, reducing deployment time to 2 days and enabling continuous production monitoring.
- Developed a mobile app with OpenAI API integration for 20 field technicians, automating inspection reports and saving 3 weeks/year of manual data collection.
- Led UX design and user testing for the field-technician Java app, iterating on interface and workflow based on feedback from 20 field technicians to improve adoption and reduce reporting friction.

Data Engineer, UK Data Service — Colchester, UK — Jan 2023 — Oct 2025

- Trained, fine-tuned, and deployed classification PyTorch, scikit-learn, BERT models using Hugging Face, vLLM, and Ollama for automated metadata classification and disclosure risk assessment in line with ONS statistical disclosure control (SDC) methodology, achieving 95%+ F1 accuracy on sensitive social science datasets, integrating and linking training data from multiple external sources.
- Deployed and orchestrated ML retraining pipelines using AWS Lambda, Step Functions and infrastructure-as-code practices, with monitoring for drift and accuracy to trigger automated retrains — reducing manual intervention by 50%.
- Built ETL pipelines to extract, transform, and query PostgreSQL-hosted socioeconomic data of 100K+ records as model inputs for automated metadata classification, improving throughput and classification accuracy at scale.
- Developed a LangGraph-based agent-to-agent (A2A) workflow with hallucination checks to automate exploratory data analysis (EDA) — including dataset loading, statistical description, and property derivation — reducing the time independent researchers spent on manual data analysis.

Research Officer & Teaching Assistant, University of Essex — Colchester, UK — Oct 2021 — Dec 2022

- Migrated quantitative macroeconomic models from MATLAB to C++, reducing simulation runtime 8x for collaborations with other universities in the UK.
- Delivered lectures and labs in Data Structures, C/C++, and Machine Learning to 100+ undergrad and postgrad students, achieving an average student feedback score of 4.8/5.

Projects

MTG Card Reader — ivan020.github.io/MtgRecognizer/

- Built a Dockerised Golang REST API that uses OCR to extract text from Magic: The Gathering card photos, identifies the card via LLM, and returns real-time price data from a PostgreSQL-backed catalogue, displayed via the TypeScript React frontend.

Education

University of Essex, PhD in Computational Finance — Oct 2021 — May 2025

- Developed a transfer learning framework for Bayesian model averaging in financial forecasting, first-authored a peer-reviewed CS/ML journal publication, and co-authored international conference papers; released an open-source package with external adoption.

University of Essex, MSc in Financial Econometrics — Oct 2020 — Sep 2021

- Sole-authored a modular Python agent-based simulation modelling household consumption, employment, and borrowing behaviour under dynamic and negative interest rates, with an extensible architecture supporting additional firm and household modules.
