

Ivan Evdokimov

Manchester, UK | ivevdm@gmail.com | linkedin.com/in/ivan-evdokimov | github.com/ivan020

Professional Summary

Full Stack Software Engineer with 4+ years of experience building cloud-native platforms, distributed backend services, IoT/edge applications, and AI-powered infrastructure. Experienced in scalable APIs, React frontends, CI/CD pipelines, infrastructure-as-code, and containerized deployments using Go, Python, JavaScript, Docker, Terraform, AWS, and PostgreSQL. Proven track record deploying secure production-grade services with automated testing, monitoring, workflow automation, and scalable infrastructure across enterprise and research environments. Strong background in backend architecture, observability, MLOps, and distributed systems.

Additional experience includes independent development of automation tooling, edge-computing applications, and real-time backend systems.

Selected Experience

Full Stack Software Engineer, University of Essex — Colchester, UK Nov 2025 — Present

- Architected and deployed cloud-native CI/CD infrastructure using GitHub Actions, Docker, Vercel, and automated deployment workflows supporting rapid release cycles and production-grade reliability, and observability.
- Built scalable backend services and workflow automation pipelines for AI-assisted software delivery platforms, reducing engineering overhead by 60% and accelerating deployment frequency from monthly to weekly releases.
- Designed automated testing and validation pipelines for AI-generated codebases, improving deployment stability, security validation, and release confidence across distributed services.

Backend / ML Infrastructure Engineer, UK Data Service — Colchester, UK Jan 2023 — Oct 2025

- Developed distributed backend services and serverless infrastructure on AWS using Lambda, Step Functions, EFS, and Terraform for large-scale automated data processing and model deployment workflows.
- Designed REST-based APIs, data models and automated data pipelines supporting secure processing of sensitive datasets and high-volume classification services.
- Containerized production services using Docker to standardize deployments, improve portability, and streamline CI/CD workflows across development and production environments.
- Implemented scalable deployment workflows using containerized services, model serving infrastructure, and automated validation processes using Hugging Face, vLLM, and Ollama.

Selected Projects

FinBot: Real-Time Trading Simulation Platform github.com/ivan020/FinBot

- Built a real-time distributed trading simulation platform in Go with backend APIs, PostgreSQL persistence, and live event processing integrated with Twitch chat systems.
- Developed interactive JavaScript frontend dashboards for portfolio monitoring and real-time state management.
- Designed scalable backend services supporting concurrent user interaction, automated portfolio updates, and event-driven communication workflows.
- Implemented cloud deployment workflows and real-time data synchronization infrastructure.

MTG Card Reader ivan020.github.io/MtgRecognizer/

- Built lightweight edge-computing services on Raspberry Pi optimized for low-latency execution using Python FastAPI, C++ , PostgreSQL, and Docker for low-latency image processing and remote inference workflows.
- Developed a React-based frontend interface for image uploads, diagnostics, and real-time recognition visualization.
- Designed backend APIs and optimized OCR processing pipeline achieving 97%+ recognition F1 score with production deployment supporting daily active users.
- Implemented containerized deployment workflows and remote diagnostics and service management for edge devices.

Education

University of Essex, PhD in Computational Finance Oct 2021 — May 2025

- Developed PyTorch-based transfer learning framework for Bayesian model averaging in financial forecasting; published peer-reviewed papers and released open-source package adopted externally.

University of Essex, MSc in Financial Econometrics Oct 2020 — Sep 2021

- Built C++ agent-based financial simulation modeling macroeconomic dynamics under negative interest rates.

Technical Stack

Python, Golang, JavaScript/React, Docker, Terraform, AWS, PostgreSQL, CI/CD, REST APIs, Linux (Arch)
